Hydraulic Oil Filtering

Filter Technology approached Nylex offering their services to raise the level of hydraulic oil cleanliness in our production machines. Subsequently, after some discussion, a trial filter pack was supplied and installed by Filter Technology for evaluation.

Over the following months the oil cleanliness in the trial system improved dramatically with a noticeable decrease in the amount of downtime due to hydraulic problems, compared with prior to the installation of the filter pack.

During the entire exercise, Filter Technology have conducted themselves most professionally, providing periodic oil analysis's including interpretation of results, as well as background information on oil cleanliness and its effect on equipment performance.

Filter Technology Australia have demonstrated their expert knowledge in the area of oil filtration and cleanliness standards, and provided excellent backup service and advice.
